

220 Angle Kit Installation Instructions

The kit contains two pieces of tubing bent 20 degrees to allow a 20 degree or 40 degree deflection in pole connection:

Either piece may be attached to any pole, both at the bottom of the pole and the top of the pole, depending on how much deflection you need to make it easier to remove snow from your roof:

The most common placement will be between the first and the second pole, and the two pieces can be connected together if needed for greater deflection.
